

TASK	RPAS (Drone Operation)		
HAZARDS	Struck-by (Drone Impact)	Equipment Malfunction	Loss of Control / Flyaway
	Battery Fire / Thermal Runaway	Overhead Powerlines	Visibility Obstruction
	Ground Workers	Weather Conditions (Wind, Rain, Lightning)	Other Vehicles / Traffic
	Communication	Vehicle Traffic Interference	Radio Signal Interference
	Fatigue / Human Error	Blind Spots	Unauthorized Airspace Entry
	Privacy Concerns	Overhead Powerlines	Communication Failures
PPE	   		

PRE-START CHECKS

- Confirm pilot holds valid Transport Canada RPAS certification (Basic or Advanced as required)
- Verify RPAS registration and identification marking are compliant
- Review airspace classification and check NOTAMs
- Confirm site authorization and client approval
- Inspect airframe, arms, landing gear, and propellers for cracks or damage
- Check battery charge level and inspect for swelling or overheating
- Confirm controller, firmware, and GPS connection are functional
- Establish designated takeoff and landing zone clear of personnel
- Identify hazards: cranes, powerlines, moving equipment, traffic
- Confirm communication plan with supervisor and ground crew

SAFE OPERATING PROCEDURE

- Maintain Visual Line of Sight (VLOS) at all times
- Do not fly over workers, public, or active traffic lanes
- Maintain required separation distances from people and structures
- Keep safe distance from overhead powerlines and energized conductors
- Monitor battery level and initiate return-to-home at safe threshold
- Suspend operations during high winds, precipitation, or lightning
- Use a visual observer when operating in complex or congested areas
- Avoid flying directly above heavy equipment or blind zones
- Land immediately if signal loss, erratic behavior, or system warning occurs
- Follow all applicable Transport Canada RPAS regulations

POST OPERATION PROCEDURE

- Power down aircraft and controller safely
- Remove and inspect batteries for heat or damage
- Inspect propellers and frame for cracks or wear
- Download, secure, and back up flight logs and imagery
- Record flight details in RPAS logbook (location, pilot, duration, purpose)
- Recharge batteries in approved area away from combustibles
- Secure RPAS equipment in protective case
- Report any anomalies, near misses, or airspace conflicts
- Notify supervisor that flight is complete
- Store equipment in designated secure location
